France blames Iran for cyberattack on freezers – 12th November 2026

Level 0

France blamed Iran for a cyberattack on supermarket freezers. The attack hit 700 stores. Hackers took control of cooling systems. Temperatures reached 50 degrees, so a lot of frozen food melted. Stores threw it away because it was not safe to eat. Iran said it didn't carry out the attacks. It blamed France.

Cyberattacks could be more dangerous in the future. A cybersecurity expert said hackers could soon attack services like water and electricity. They could also attack hospitals, airports, public transport and banks. This can put people's lives in danger. European leaders want to make their cybersecurity stronger.

Level 1

France blamed Iran for a cyberattack on supermarket freezers and refrigerators. The attack hit around 700 stores. Hackers took control of the cooling systems in the freezers. Temperatures went up to around 50 degrees. A lot of frozen food melted. Stores had to throw it away. It was not safe to eat. France said the attack was on a level never seen before. Iran said it didn't carry out the attacks. It blamed the French government for them.

Security experts said cyberattacks could be more dangerous in the future. They could hit other things. A French cybersecurity expert said that at the moment, hackers are attacking easy-to-access things. Hackers could soon attack services like water and electricity. They could also attack hospitals, airports, public transport and banks. This can put people's lives in danger. European leaders said countries need to make their cybersecurity stronger.

Level 2

France has blamed Iran for a cyberattack on supermarket freezers and refrigerators. The attacks happened last month. They hit around 700 stores. Hackers took control of the cooling systems in the fridges and freezers. Temperatures went up to more than 50 degrees Celsius. Huge amounts of frozen food melted. Stores had to throw it away because it was not safe to eat. France said the attack was on a level never seen before. France believes an Iranian cyber unit carried out the attack. Iran said it didn't do the attacks. It blamed the French government for them.

Security experts warned that cyberattacks could be more dangerous in the future. They could hit other things. A French blood bank has also been hit. A French cybersecurity expert said that at the moment, hackers are attacking easy-to-access things. He said there could be attacks on other things. Hackers could attack services like water and electricity. They could also attack hospitals, airports, public transport and banks. This can put people's lives in danger. Leaders in Europe have said countries need to make their cybersecurity stronger.

Level 3

The French government has blamed Iran for a cyberattack on supermarket freezers and refrigerators across France. The attacks happened last month. They hit around 700 supermarkets and shops. Hackers took control of the cooling systems in the fridges and freezers. Temperatures increased to more than 50 degrees Celsius. Thousands of tons of frozen food melted. Stores had to throw the food away because it was no longer safe to eat. The French Foreign Minister said the attack was on a level never seen before. France believes an Iranian cyber unit carried out the attack. Iran has strongly denied it was involved in the attacks and blamed the French government for them.

Security experts have warned that cyberattacks could be more dangerous in the future. Similar attacks have already affected other European countries. A French blood bank has also been hit. Fortunately, workers stopped the blood products from being damaged. Cybersecurity expert Gerome Billois stated: "At the moment, they are attacking easy equipment, but we should be prepared to see attacks on other systems like water or electricity." Weak computer security can let hackers attack places and services, such as hospitals, airports, public transport and banks. This can put people's lives in danger. European officials have said that a strong response is needed.
